SPADE3 Project

A Message to Input & Equipment Manufacturers

There is a gap in where precision ag is today versus where it can and should be, due to lack of standardization. Your company can help by hosting an API or by sourcing data through a partner. A few of the benefits of an API are enabling better data continuity through the supply chain, an increased chance that your products are used according to their label, and controlling the documentation of your products.

PAIL Questions?

Contact Dan Berne

PAIL Project

The PAIL data standards enable the flow of data necessary to plan and execute precision irrigation. Companies using the PAIL standards provide added value to growers, decrease their own operational costs, and help grow the market with new, integrated irrigation solutions.
